

Worker - Architecture

- **FastAPI should probably be labeled Uvicorn + FastAPI or matchmaking-api**, because Uvicorn is the actual HTTP server listening on `:8000`.
- **The worker does not sit behind nginx** and does not receive client HTTP requests.
- **FastAPI pushing to Redis, then worker consuming from Redis, then worker updating Postgres is accurate.**
- **The CI/CD pipeline arrows should be dashed or separated**, because CI/CD deploys/builds services; it is not part of the live request path.
- **Monitoring/logging is also an operations concern**, not application business flow. It watches/scrapes/receives logs from gateway, API, worker, and maybe databases.
